GERBER
TECHNOLOGY

GerberColor™ Spectratone™

*Spectra*Tint
*Spectra*Shade

The Power of Two:

GerberColor™ SpectraTint™/ Transparent White and SpectraShade™/ Transparent Grey, two foils designed to modify the appearance of the base color foils with solid fill pring, not with halftones.

Use SpectraTint on top of a base color to produce tinted highlights without gradients. SpectraTint has the effect of lightening or soft-ening the base color much in the same way tints are used in screen printing to lighten ink colors.

Use SpectraShade on top of a base color to darken that color without gradients. SpectraShade has the effect of shading the base color to darken its tone.

These "Spectra" foils offer customers a wider range of EDGE-printed spot colors, to better match hard to hit corporate identity jobs or to create shading effects on shapes and large text.
